

Thank you for using DARBUKATOR LITE

Using the module is similar to using any other Darbukator so feel free to download the complete Manual from our web site www.httmusic.com/support.html

Install

Copy the DLL to the VST plugins and the midi file and the manual anywhere you like

It's important not to lose or edit the midi file to use the instrument

How to use

1. Chose the right style
2. Load the associated midi file in to your host in a separate track and be sure to assign it to channel ANY or ALL
Because the midi file is type 0 (you can separate the tracks if you like)
3. Repeat the midi loop for the length of your song
(In some hosts like Sonar you have to check that the snap is 1 bar for copying to get quantized playing)
4. Create a new track for your playing and give it the keyboard midi channel number 16
5. Hit play in the host and use this track to play/record your beats (you can use this track to record the four instruments)
6. Repeat steps 4 & 5 for each instrument

Important notes:

The styles midi channels are 1-4, and the keyboard channel is 16, you cannot change them.

Every channel uses one full octave starting from C1 (C is the off note and B is a separator)

Darbukator Lite is a VSI instrument in needs a VST compatible host

For any information and help please contact us at contact@httmusic.com or support@httmusic.com

Please add the name of your instrument in the subject so we can reply faster
