

Solara

Soundset for SOL

Solara was created as the official companion preset pack for SOL, designed by Chris Bryant (S1gns Of L1fe and Starterra) and Grammy-Nominated mastering engineer and electronic musician Don Tyler. It contains 20 handcrafted presets that reveal new dimensions inside SOL, the signature granular delay and reverb instrument born from the collaboration between S1gns Of L1fe and Dawesome.

Each preset explores a different contour of SOL's hybrid engine and transforms incoming audio into spacious textures, drifting grains or slow blooming atmospheres. The collection includes shimmering granular washes, evolving trails, deep spatial modulations and immersive ambient reverbs. Solara is a creative toolkit for electronic ambient music, cinematic scoring and professional sound design, crafted to help you shape movement, depth and emotion with clarity and precision.

- 1.** Open up SOL in your DAW and click on the three-lined menu in the middle.
- 2.** Choose the option "REVEAL" and then choose "USER PRESETS DIR" to open the USER library on your computer.
- 3.** Copy the entire folder "Ascendant - Solara" into this folder and restart your DAW.
- 4.** The presets are now installed and available in the preset selection menu.

Thank you for purchasing Solara and thank you for supporting Material
